
Flexible licensing and deployment options for cost effective access

There are two licence types available for you to choose from, with the option to share licences between team members for increased cost-effectiveness:

◆ Asta Powerproject Single-User Licence

Simplest licence where the software is installed and licensed on one computer only. However, the licence can periodically be transferred to another machine if required. The project data is stored as a single file which can be saved on a local drive or a shared location.

Ideal for full-time planners, individual users and those working away from the office.

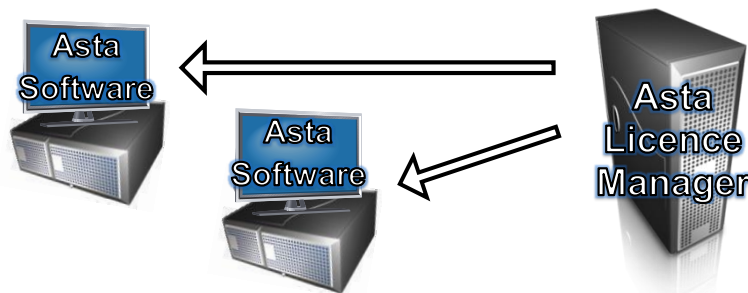

◆ Asta Powerproject Concurrent User Licence

The Asta Powerproject software can be installed on any number of computers which all point to a central machine on the internal company network where the licences are held. This licence server counts how many people are using the software and ensures that this number does not exceed the licensed quantity at any one time.

Project data is still held either locally or on file shares – but only one user can open and edit a project file at the same.

Concurrent licences can be temporarily loaned for a predetermined time to a designated machine, allowing Asta Powerproject to be used when offline from the company network.

Ideal for teams who are office based and only require periodic or part-time access to a licence.

Need multi-user access to the same project file?

With the above options, only one user can be working on the same project file at the same time. **Asta Powerproject Enterprise** is a version of the tool which empowers multi-user access on projects, allowing collaboration, effective resource management and information sharing.

Please contact the sales team for more information on the Enterprise version.
